TITLE:  Treatment of Urinary Tract Infections in the Elderly: Clinical Effectiveness and Guidelines

DATE:  03 February 2015

RESEARCH QUESTIONS

1. What is the comparative clinical effectiveness of long-term antibiotic prophylaxis and treatment of urinary tract infections (UTIs) in the elderly?

2. What are the evidence-based guidelines regarding the management of UTIs with antibiotics in the elderly?

KEY FINDINGS

Two evidence-based guidelines regarding the management of UTIs with antibiotics in the elderly were identified.

METHODS

A limited literature search was conducted on key resources including PubMed, The Cochrane Library (2015, Issue 1), University of York Centre for Reviews and Dissemination (CRD) databases, Canadian and major international health technology agencies, as well as a focused Internet search. To address research question one, no filters were applied to limit the retrieval by study type. To address research question two, methodological filters were applied to limit retrieval to guidelines. Where possible, retrieval was limited to the human population. The search was also limited to English language documents published between January 1, 2010 and January 28, 2015. Internet links were provided, where available.

The summary of findings was prepared from the abstracts of the relevant information. Please note that data contained in abstracts may not always be an accurate reflection of the data contained within the full article.
SELECTION CRITERIA

One reviewer screened citations and selected studies based on the inclusion criteria presented in Table 1.

UTI = urinary tract infection

RESULTS

Rapid Response reports are organized so that the higher quality evidence is presented first. Therefore, health technology assessment reports, systematic reviews, and meta-analyses are presented first. These are followed by randomized controlled trials, non-randomized studies, and evidence-based guidelines.

Two evidence-based guidelines regarding the management of UTIs with antibiotics in the elderly were identified. No relevant health technology assessment reports, systematic reviews, meta-analyses, randomized controlled trials, or non-randomized studies were identified.

Additional references of potential interest are provided in the appendix.

OVERALL SUMMARY OF FINDINGS

Two evidence based guidelines\(^1,2\) regarding the management of UTIs in the elderly were identified. The guidelines were targeted towards adults in general, including but not limited to the elderly.

Both guidelines\(^1,2\) make recommendations against antibiotic prophylaxis for UTIs as well as antibiotic treatment of asymptomatic bacteriuria in catheterized patients, suggesting treatment only for symptomatic infection.

The guideline by the Scottish Intercollegiate Guidelines Network\(^1\) recommended that all women with symptomatic UTIs be treated with a three day course of trimethoprim or nitrofurantoin, and that care be taken when prescribing nitrofurantoin to elderly women due to possible increased risk of toxicity. It recommends that adult men be treated with a quinolone if presenting with symptoms suggestive of prostatitis.\(^1\)

The guideline by the European Association for Urology\(^2\) does not recommend chronic antibiotic suppressive therapy for the prevention of UTIs. Regarding treatment, it suggests broad spectrum antibiotics for empirical therapy with adjustment based on pathogen sensitivity once culture results become available.
