TITLE: The Standardized Mini-Mental State Exam for Screening Adults with Cognitive Impairment: Clinical Effectiveness and Diagnostic Accuracy

DATE: 18 February 2010

RESEARCH QUESTIONS:

1. What are the diagnostic accuracy, validity, and reliability of using the Standardized Mini-Mental State Exam screening tool in adults with cognitive impairment?

2. What is the evidence for the use of the Standardized Mini-Mental State Exam screening tool for the prediction of functional outcomes such as daily living activities?

METHODS:

A limited literature search was conducted on key health technology assessment resources, including PubMed, PsycINFO, PEDRO, OT Seeker, the Cochrane Library (Issue 1, 2010) including DARE, University of York Centre for Reviews and Dissemination (CRD) databases, ECRI, EuroScan, international health technology agencies, and a focused Internet search. The search was limited to English language articles published between 1999 and Feb 2010. Filters were applied to limit the retrieval to health technology assessments, systematic reviews, meta-analyses, randomized controlled trials, controlled clinical trials and observational studies. Internet links were provided, where available. Due to the large numbers of results identified by the literature search, only studies from 2005 to 2010 were included in this report.

RESULTS:

HTIS reports are organized so that the higher quality evidence is presented first. Therefore, health technology assessment reports, systematic reviews, and meta-analyses are presented first. These are followed by randomized controlled trials, controlled clinical trials, and observational studies.

One meta-analysis, one controlled clinical trial, and 37 observational studies were identified regarding the diagnostic accuracy, validity, and reliability of using the Standardized Mini-Mental State Exam screening tool for screening adults with cognitive impairment.

Disclaimer: The Health Technology Inquiry Service (HTIS) is an information service for those involved in planning and providing health care in Canada. HTIS responses are based on a limited literature search and are not comprehensive, systematic reviews. The intent is to provide a list of sources of the best evidence on the topic that CADTH could identify using all reasonable efforts within the time allowed. HTIS responses should be considered along with other types of information and health care considerations. The information included in this response is not intended to replace professional medical advice, nor should it be construed as a recommendation for or against the use of a particular health technology. Readers are also cautioned that a lack of good quality evidence does not necessarily mean a lack of effectiveness particularly in the case of new and emerging health technologies, for which little information can be found, but which may in future prove to be effective. While CADTH has taken care in the preparation of the report to ensure that its contents are accurate, complete and up to date, CADTH does not make any guarantee to that effect. CADTH is not liable for any loss or damages resulting from use of the information in the report.

The Standardized Mini-Mental State Exam for Screening Adults with Cognitive Impairment

State Exam screening tool in adults with cognitive impairment. Five observational studies were identified regarding the evidence for the use of the Standardized Mini-Mental State Exam screening tool for the prediction of functional outcomes such as daily living activities. No relevant health technology assessments, systematic reviews, or randomized controlled trials were identified. Additional articles of potential interest can be found in the appendix.

Health technology assessments
No literature identified

Systematic reviews and meta-analyses

Randomized controlled trials
No literature identified

Controlled clinical trials

Observational studies
