TITLE: Sensory Processing in Children: Comparative Effectiveness and Guidelines

DATE: 19 September 2016

RESEARCH QUESTIONS

1. What is the comparative effectiveness of the sensory processing measure versus the sensory profile 2?

2. What are the evidence-based guidelines regarding the assessment and treatment of sensory processing challenges in children?

KEY FINDINGS

No relevant literature was identified regarding the clinical effectiveness of the sensory processing measure compared with the sensory profile 2. In addition, no relevant evidence-based guidelines were identified regarding the assessment and treatment of sensory processing challenges in children.

METHODS

A limited literature search was conducted on key resources including PubMed, The Cochrane Library, University of York Centre for Reviews and Dissemination (CRD) and CINAHL databases, Canadian and major international health technology agencies, as well as a focused Internet search. For research question 1, no methodological filters were applied to limit retrieval by study type. For research question 2 methodological filters were applied to limit retrieval health technology assessments, systematic reviews, meta-analyses, and guidelines. Where possible, retrieval was limited to the human population. The search was also limited to English language documents published between January 1, 2011 and September 9, 2016. Internet links were provided, where available.

SELECTION CRITERIA

One reviewer screened citations and selected studies based on the inclusion criteria presented in Table 1.

Disclaimer: The Rapid Response Service is an information service for those involved in planning and providing health care in Canada. Rapid responses are based on a limited literature search and are not comprehensive, systematic reviews. The intent is to provide a list of sources of the best evidence on the topic that the Canadian Agency for Drugs and Technologies in Health (CADTH) could identify using all reasonable efforts within the time allowed. Rapid responses should be considered along with other types of information and health care considerations. The information included in this response is not intended to replace professional medical advice, nor should it be construed as a recommendation for or against the use of a particular health technology. Readers are also cautioned that a lack of good quality evidence does not necessarily mean a lack of effectiveness particularly in the case of new and emerging health technologies, for which little information can be found, but which may in future prove to be effective. While CADTH has taken care in the preparation of the report to ensure that its contents are accurate, complete and up to date, CADTH does not make any guarantee to that effect. CADTH is not liable for any loss or damages resulting from use of the information in the report.

Table 1: Selection Criteria

<table>
<thead>
<tr>
<th>Population</th>
<th>Children (2-18 years of age)</th>
</tr>
</thead>
</table>
| Intervention     | Q1: Sensory processing measure  
|                  | Q2: Any assessment type;  
|                  |     Any treatment associated with sensory processing challenges |
| Comparator       | Q1: Sensory profile 2  
|                  | Q2: No comparator |
| Outcomes         | Q1: Clinical effectiveness;  
|                  | Q2: Guidelines and clinical practice |
| Study Designs    | Health technology assessments, systematic reviews, meta-analyses, randomized controlled trials, non-randomized studies, evidence-based guidelines |

RESULTS

No relevant health technology assessments, systematic reviews and meta-analyses, randomized controlled trials, or non-randomized studies were identified regarding the clinical effectiveness of the sensory processing measure compared with the sensory profile 2. In addition, no relevant evidence-based guidelines were identified regarding the assessment and treatment of sensory processing challenges in children.

References of potential interest are provided in the appendix.

OVERALL SUMMARY OF FINDINGS

No relevant literature was identified regarding the clinical effectiveness of the sensory processing measure compared with the sensory profile 2. In addition, no relevant evidence-based guidelines were identified regarding the assessment and treatment of sensory processing challenges in children; therefore, no summary can be provided.
