**About CADTH:** CADTH is an independent, not-for-profit organization responsible for providing Canada’s health care decision-makers with objective evidence to help make informed decisions about the optimal use of drugs, medical devices, diagnostics, and procedures in our health care system.
Research Questions

1. What is the cost-effectiveness of nutritional interventions for the delayed progression or reversal of frailty?

2. What is the cost-effectiveness of exercise interventions for the delayed prevention or reversal of frailty?

Key Findings

One systematic review and four economic evaluations were identified regarding the cost-effectiveness of nutritional or exercise interventions for the delayed progression or reversal of frailty.

Methods

A limited literature search was conducted on key resources PubMed, The Cochrane Library, University of York Centre for Reviews and Dissemination (CRD) databases, Canadian and major international health technology agencies, as well as a focused Internet search. Methodological filters were applied to limit retrieval to health technology assessments, systematic reviews, and meta-analyses, and economic studies. The search was limited to English language documents published between January 1, 2013 and May 29, 2018. Internet links were provided, where available.

Selection Criteria

One reviewer screened citations and selected studies based on the inclusion criteria presented in Table 1.

Table 1: Selection Criteria

Results

Rapid Response reports are organized so that the higher quality evidence is presented first. Therefore, health technology assessment reports, systematic reviews, and meta-analyses are presented first. These are followed by economic evaluations.

One systematic review and four economic evaluations were identified regarding the cost-effectiveness of nutritional or exercise interventions for the delayed progression or reversal of frailty. No relevant health technology assessments were identified.

Additional references of potential interest are provided in the appendix.

Overall Summary of Findings

One systematic review\(^1\) was identified regarding the cost-effectiveness of nutritional or exercise interventions for the delayed progression or reversal of frailty. The authors of the systematic review evaluated the clinical and cost-effectiveness of reablement versus home care or waitlist for older adults who were at risk for functional decline.\(^1\) They found that reablement was less costly than usual care but the conclusion was based on only one study that was determined to be of very low quality.\(^1\)

Four economic evaluations\(^2-5\) were identified. A cost-effectiveness model\(^2\) of a physiotherapy-based intervention for frail older persons found an incremental cost per quality-adjusted life year (QALY) gained of $8129 (Australian dollars) as compared with usual care; however, the model also identified a probability that usual care would be more effective and less costly than the physiotherapy intervention.\(^2\)

A Japanese study\(^3\) assessed the cost-effectiveness of a community-based nutrition and oral health intervention for the prevention of disability in the frail elderly. Over the 28 months of the study, the intervention was found to be less expensive than usual care but the difference in cost was not statistically significant.\(^3\) A cost-utility analysis of the INTERACTIVE trial\(^5\) compared the management of elderly patients with a hip fracture by a physical therapist and dietician with social visits for six months. The administration costs between the intervention and control were not significantly different.\(^5\) There was a higher mean gain in QALYs in the intervention group but this difference was also not statistically significant.\(^5\) In another economic evaluation, a HomeHealth promotion intervention was compared with usual treatment for community-dwelling adults with mild frailty.\(^4\) Significantly better functioning, better grip strength, reduced psychological distress, and increased capability-adjusted life years were achieved after six months with the intervention.\(^4\) The difference in costs between the HomeHealth intervention and usual treatment were not reported in the abstract but the authors did indicate that the intervention was administered at a “modest cost.”\(^4\)
